# Dandeli Wildlife Sanctuary, Dandeli near Dharwad

Dandeli Wildlife Sanctuary is located in Uttara Kannada and covers an area of 334.52 sq mi. It is an ideal holiday destination for nature lovers. The sanctuary is easily accessible by road, rail and air. It lies at a distance of 57 kms from Dharwad which is the closest location to reach the sanctuary.

The Dandeli wildlife sanctuary is the second largest sanctuary in Karnataka and is located on the banks of River Kali. It is surrounded by thick forests and hills of the Kannada District. It has a rich diversity of the plants and animals in and around the sanctuary.

## Dandeli Wildlife Sanctuary – Spot Crocodiles and Birds

The sanctuary is rich in flora and fauna. Crocodiles are a major wildlife attraction in this sanctuary. It offers a unique experience of bird watching and crocodile spotting. You can walk through the forest or enjoy bird watching. There are a variety of reptilian and amphibian species in and around the wildlife sanctuary.

You can get a glimpse of the barking deer, bison, Indian Mongolian, black panther, sambhar, tiger, leopard, elephant, flying squirrel and the Malabar giant squirrel. If you are lucky, you might catch a glimpse of the king cobra, tiger or giant iguana in the thick and dense forest.

Dandeli Wildlife Sanctuary is a paradise for bird watchers with more than 200 species of birds. The dense deciduous trees and evergreen trees, including bamboo and teak cover the entire forest area. Some of the birds include Blue throated Barbet, Great Pied Hornbill, Malabar Pied Hornbill and Peregrine falcon.

## Sloth bear

The **sloth bear** (*Melursus ursinus*) is a myrmecophagous bear species native to the Indian subcontinent. It feeds on fruits, ants and termites. It is listed as Vulnerable on the IUCN Red List, mainly because of habitat loss and degradation.<sup>[1]</sup>

It has also been called "labiated bear" because of its long lower lip and palate used for sucking insects.<sup>[2]</sup> It has a long, shaggy fur, a mane around the face, and long, sickle-shaped claws. It is lankier than brown and Asian black bears. It shares features of insectivorous mammals and evolved during the Pleistocene from the ancestral brown bear through convergent evolution.

## FAUNA AND DIVERSITY OF DANDALI

### Black panther

#### Melanism in the genus *Panthera*

Melanism in the jaguar is conferred by a dominant allele, and in the leopard (*Panthera pardus*) by a recessive allele. Close examination of the colour of these black cats will show that the typical markings are still present, but are hidden by the excess black pigment melanin, giving an effect similar to that of printed silk. This is called "ghost striping". Melanistic and non-melanistic animals can be littermates. It is thought that melanism may confer a selective advantage under certain conditions since it is more common in regions of dense forest, where light levels are lower.<sup>[citation needed]</sup> Recently, preliminary studies also suggest that melanism might be linked to beneficial mutations in the immune system.<sup>[2]</sup>
